EXPERIMENT 14

CREATE A VIRTUAL HARD DISK USING VMWARE WORKSTATION

AIM

To create an additional virtual hard disk using VMware Workstation and verify that it is attached to the virtual machine.

SOFTWARE REQUIREMENTS

1. VMware Workstation Pro
2. A configured virtual machine (Ubuntu 64-bit)
3. Sufficient free storage space on the host computer

PROCEDURE

1. Open VMware Workstation and select the existing Ubuntu 64-bit virtual machine.

2. Make sure the virtual machine is powered off, then select Edit virtual machine settings.

3. Click Add to open the Add Hardware Wizard and select Hard Disk.

4. Choose the recommended SCSI virtual disk type and click Next.

5. Select Create a new virtual disk and click Next.

6. Set the maximum disk size to 5 GB. Keep the option to split the virtual disk into multiple files selected, then click Next.

7. Enter Experiment14.vmdk as the disk filename and click Finish.

8. Return to Virtual Machine Settings and verify that the new 5 GB hard disk appears alongside the original 15 GB disk. Click OK to save the configuration.

OBSERVATION

The virtual machine settings show the original 15 GB SCSI hard disk and a newly added 5 GB SCSI hard disk. The new virtual disk is named Experiment14.vmdk. The disk is configured as a separate virtual device and its space is not preallocated.

SCREENSHOTS

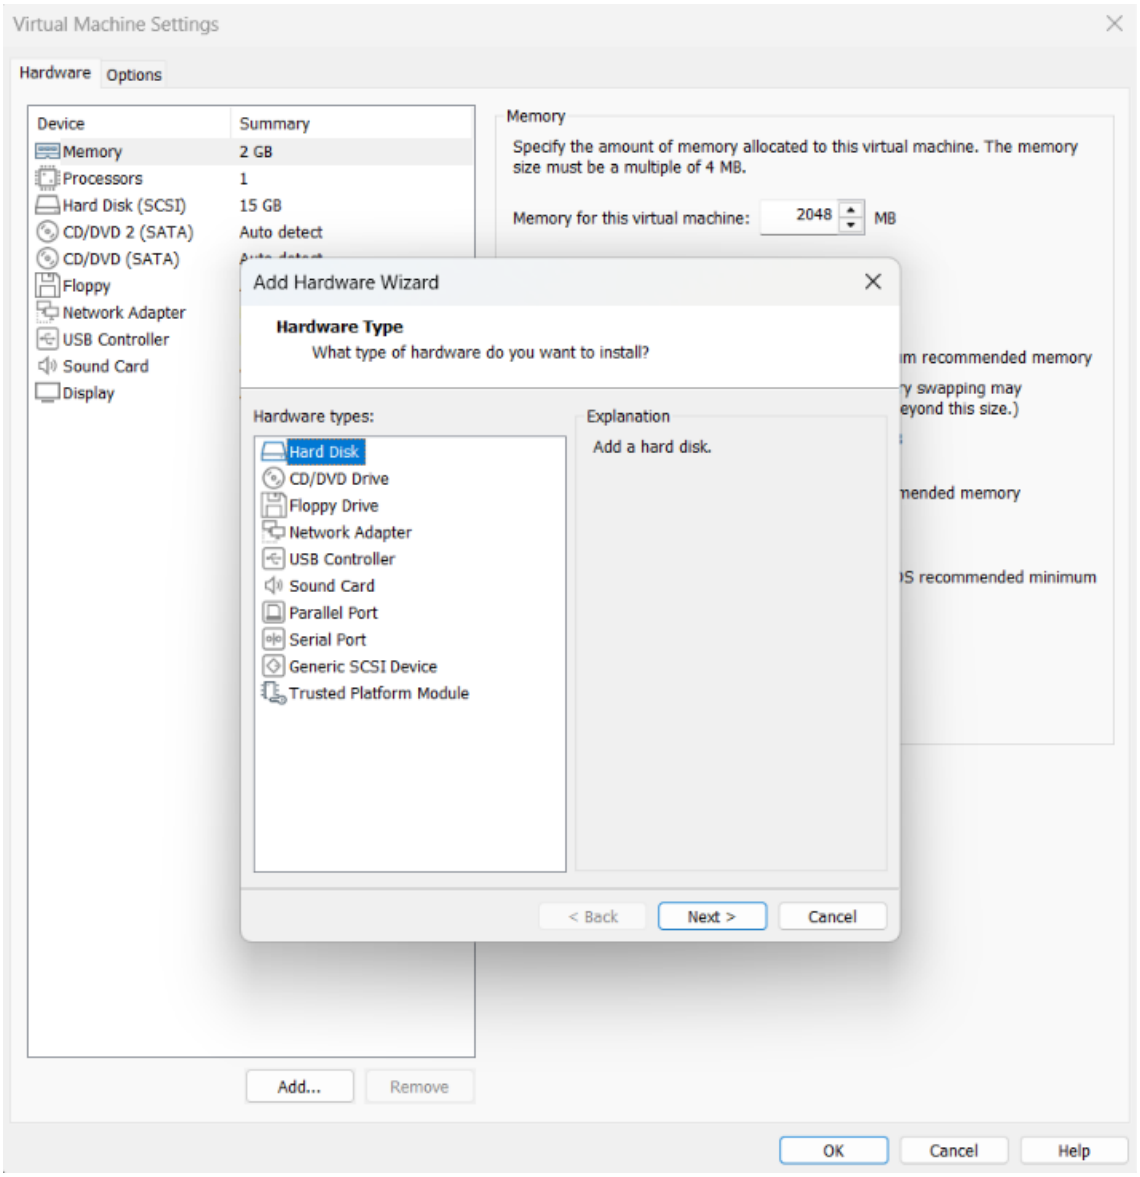

Figure 1. Selecting the Hard Disk option in VMware's Add Hardware Wizard.

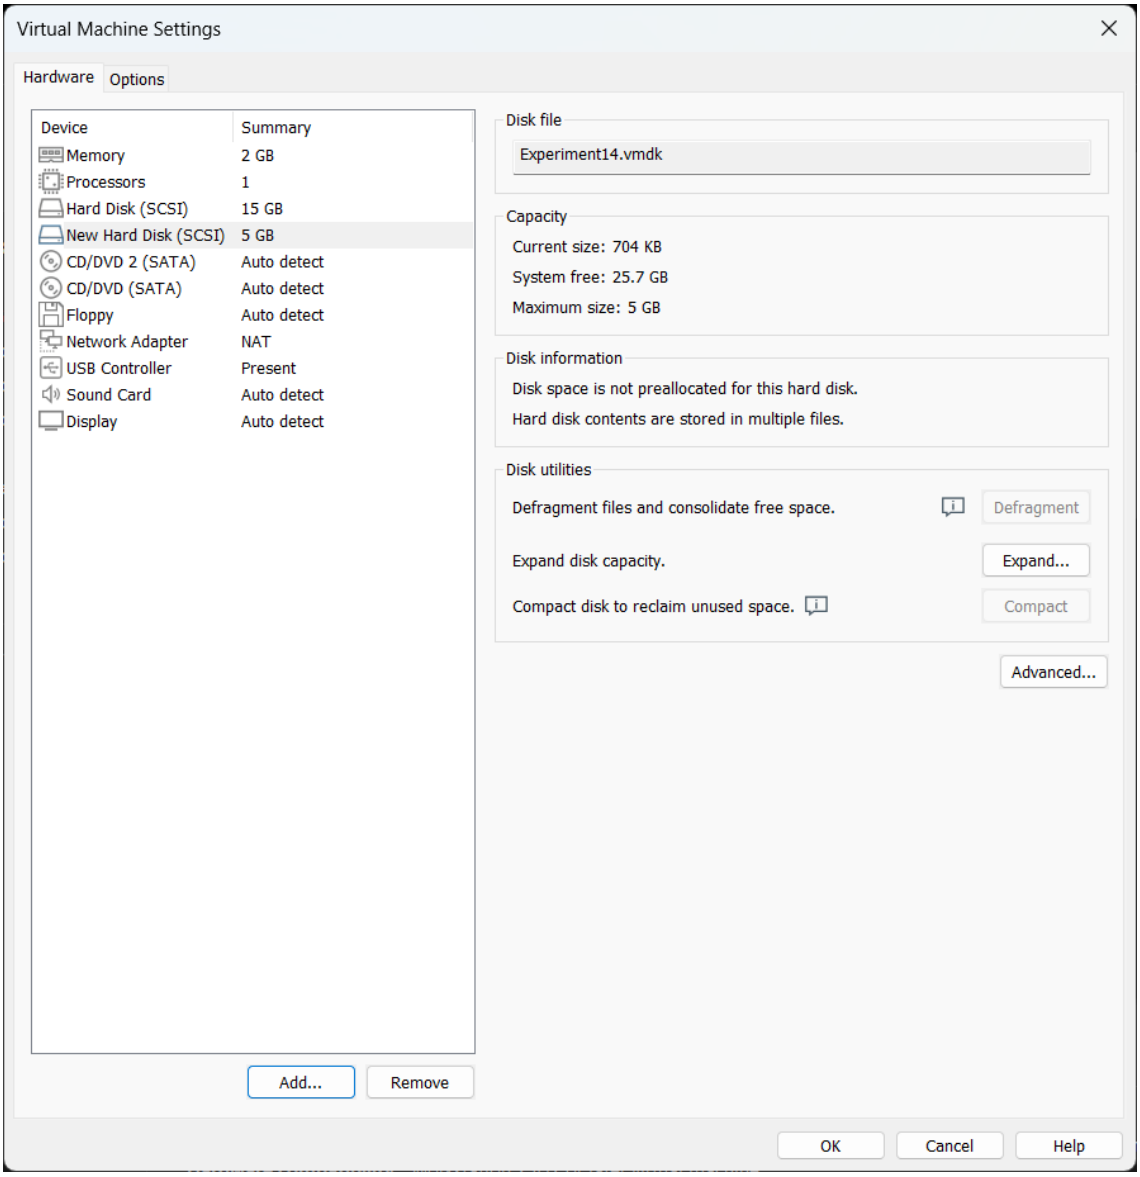

Figure 2. Newly created 5 GB virtual disk file, Experiment14.vmdk, shown in Virtual Machine Settings.

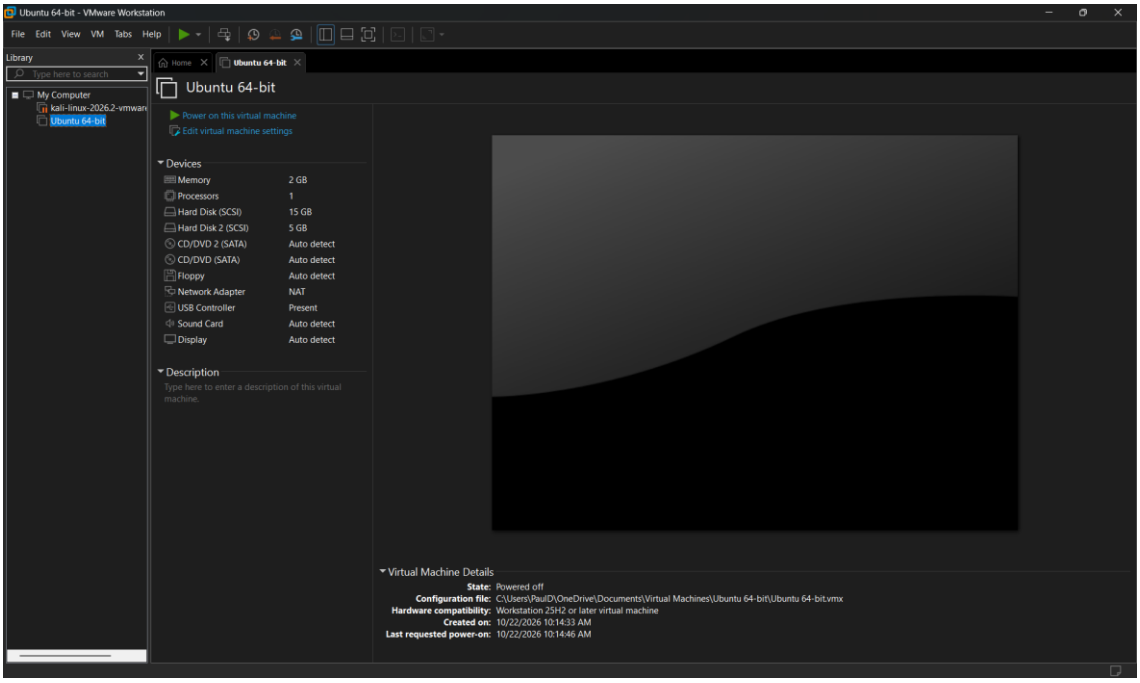

Figure 3. Final virtual machine configuration showing the original 15 GB disk and the additional 5 GB disk.

RESULT

Thus, an additional 5 GB virtual hard disk was created using VMware Workstation and successfully attached to the Ubuntu 64-bit virtual machine. The final configuration confirms the original 15 GB disk and the new 5 GB disk.
