EXPERIMENT 16
CLONING A VIRTUAL MACHINE AND TESTING IT

Aim

To create a clone of an existing virtual machine using VMware Workstation and test the cloned virtual machine.

Software Requirements

1. Windows host computer
2. VMware Workstation Pro
3. Ubuntu 18.04.3 LTS virtual machine
4. Sufficient free disk space to store the clone

Procedure

1. Open VMware Workstation and select the Ubuntu 64-bit virtual machine.
2. Ensure that the original virtual machine is powered off.
3. Open the Clone Virtual Machine Wizard using the VM management options.
4. Click Next on the welcome screen.
5. Select Create a full clone and click Next.
6. Enter "Clone of Ubuntu 64-bit" as the new virtual machine name and keep or select a suitable storage location.
7. Click Finish and wait for VMware to complete the cloning process.
8. Confirm that the wizard reports the clone operation as complete.
9. Select the new clone from the VMware Library and power it on.
10. Log in to Ubuntu and verify that the cloned virtual machine reaches the terminal login session.

Output Explanation

The following outputs show the full-clone selection, successful completion, and startup of the cloned virtual machine.

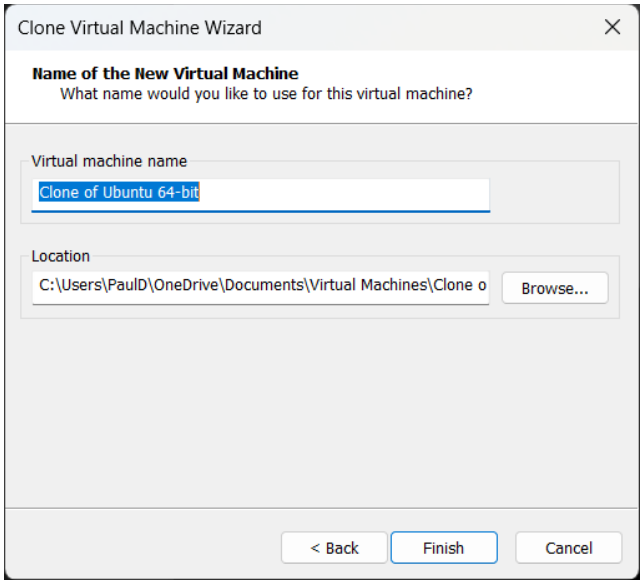

Figure 1: Full clone option selected in the Clone Virtual Machine Wizard.

This screen shows the cloning method selected. A full clone creates a separate copy of the original virtual machine, unlike a linked clone that depends on the original VM.

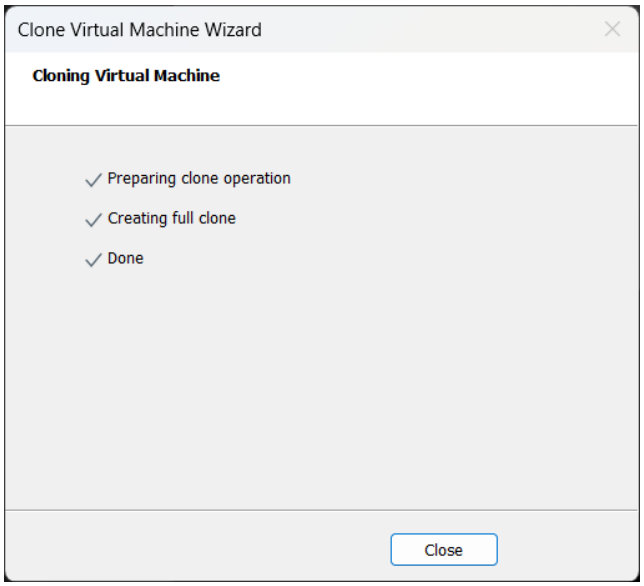

Figure 2: VMware confirms that the cloning operation is complete.

The wizard displays check marks for preparing the clone operation, creating the full clone, and completion. This confirms that VMware finished creating the clone.

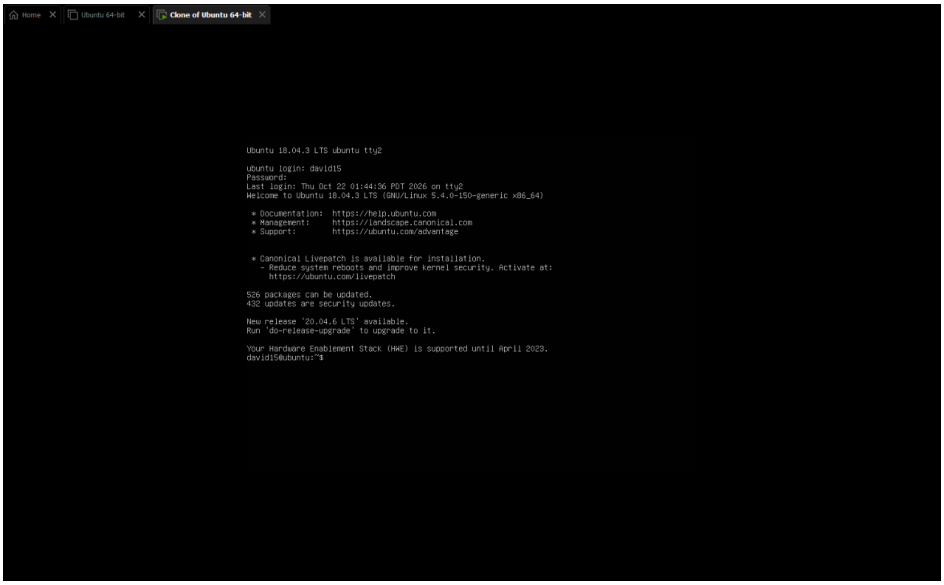

Figure 3: Ubuntu terminal login session in the cloned virtual machine.

After the clone was powered on, Ubuntu reached its terminal login session. This provides evidence that the cloned virtual machine starts successfully.

Result

A full clone of the Ubuntu virtual machine was created successfully in VMware Workstation. The completion message confirmed the clone operation, and the cloned machine reached the Ubuntu terminal login session when started. Therefore, the cloning process and basic startup test were successful.
